

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

GEOMETRY.

Conducted by B. F. FINKEL, Kidder, Mo. All contributions to this department should be sent to him.

SOLUTIONS TO PROBLEMS.

19. Proposed by J. A. CALDERHEAD, Superintendent of Schools, Limaville, Ohio.

If any point be taken in the circumference of a circle, and lines be drawn from it to the three angles of an inscribed equilateral triangle, prove that the middle line so drawn is equal to the sum of the other two.

I. Solution by CHARLES E. MYERS, Canton, Ohio; P. S. BERG, Apple Creek, Ohio; Professor F. E. MILLER, Westerville, Ohio; R. H. YOUNG, Sunbury, Pennsylvania.

Let ABC be an equilateral triangle inscribed in a circle, P any point in the circumference; and PB , PC and PA lines drawn from the point to the three angles.

On PA take $PO=PC$, and join OC . The angles OPC and OFB , being measured by equal arcs, are equal and constant $=60^\circ$, and since $PO=PC$, the triangle POC is equilateral and $OC=PC$.

In the triangles OCA and BCP we have $OC=PC$; $AC=BC$ and the angle $ACO=\text{angle } BCP$; therefore $AO=BP$. But $OP=PC$; therefore $BP+PC=PO+OA=PA$.

II. Solution by J. W. WATSON, Middle Creek, Ohio.

Let ABC be the inscribed equilateral triangle. P any point in the circumference. Join AP , CP and BP . We are to prove $AP=BP+CP$.

Put $a=$ a side of the triangle, $n=AP$, $z=BP$ and $s=CP$.

In the triangle APB , $a^2=n^2+z^2-nz$ since the angle APB is 60° .

In the triangle CPB , $a^2=s^2+z^2+sz$ since the angle CPB is 120° .

$\therefore n^2+z^2-nz=s^2+z^2+sz$, $n^2-s^2=sz+nz$ or $(n-s)(n+s)=z(n+s)$, $n-s=z$. $\therefore n=s+z$, or $AP=CP+BP$.

III. Solution by Professor J. R. BALDWIN, A. M., Davenport, Iowa, and T. A. SIMMONS, St. Mary's Kentucky.

Let P be any point in the circumference, ABC the inscribed equilateral triangle of which A and C lie next to P .

Draw AP and PC .

By a well known proposition $AB \times PC + AP \times BC = AC \times PB$, (1).

But $AB=BC=AC$, hence casting out the equal factor out of (1) we have $PC+AP=PB$.

Q. E. D.

Also solved by G. B. M. ZERR, J. H. DRUMMOND, M. A. GRUBER, J. K. ELLWOOD, and P. H. PHILBRICK. ~~etc.~~ Three other solutions without names of contributors were received.

21. Proposed by CHARLES E. MYERS, Canton, Ohio.

A cistern 6 feet in diameter contains 3 inches of water. If a cylinder, four
